Approved by: G. L. Dowdy	Date: <u>7/28/88</u>	<u>Page 5 of 7</u>

4.2 Functional Test--continued:

If question (3) is answered NO, turn off all power to the FCU and obtain schematic C-98361 and board assembly C-112401. Remove top cover of the FCU (see MAINTENANCE Section of the FCU User's Manual MN-33) and find the Small Signal circuit board that is above the transformer. Verify that the value of R21 on this board matches the resistor value specified in the Resistor Table of the Small Signal Board Schematic C-98361. If not, replace this resistor with the proper value and repeat Load Clamp Test. If the resistor value is correct, check "FAIL" and terminate the testing on this unit. Tag this unit with a date and a "FAILED LOAD CLAMP WINDOW TEST" label.

Load Clamp Window Test FAIL____

5.0 DCOUT Output Test:

5.1 Set Up:

Proceed to this test only if the Load Clamp Test has been completed. Put a check in the space provided as each step is completed.
Turn off Load Clamp Tester or DC Power Supply, and allow the
voltage to discharge.
Disconnect the Load Clamp Tester or DC Power Supply and 100 oh
ohm resistor as they are no longer needed.
✓ Attach the Load Resistor Configuration as found in Table 1 to +DCOUT and
-DCOUT.
Attach the voltmeter to the +DCOUT and -DCOUT outputs. Be sure to set the
meter to the DC scale.
Connect Variac MK-10903 output the "+PWR AC IN X1" and
"-PWR AC IN X2" of the FCU.
Set Variac voltage to zero, turn on Variac, and slowly adjust the Variac to obtain
a DCOUT voltage equal to the DC VOLTAGE FOR OUTPUT TEST voltage
shown in Table 1.
Record the DCOUT output voltage set here 85.0 (f) VDC

1.0 Instructions

This is a generic Test Procedure that will provide the testing procedures for the FCU series. The FCU Model Numbers and Test Limits are found in Table 1. This Test Procedure presents the FCU test in a check list fashion. The check list will accommodate one unit. This Test Procedure with recorded data will be provided to the customer. The last page of this document is the Quality Control copy and provides space for the data entered in blanks (a) through (i) of this Test Procedure, to be entered in table form. Copy or separate this last page for your convenience. The last page will accommodate 25 units. Familiarize yourself with Table 1 and the Quality Control form found on the last page.

	by: G. L. Dowdy Date: 7/14/88 Page 2 of 7 Date: 7/28/88
2.0	Equipment Required:
	MK-10922 Load Clamp Tester or DC Power Supply (1 Amp minimum, Maximum Voltage is Clamp Threshold found in Table 1) MK-10903 Variac (22 amp rms Max, 13.3 amp DC Max) Oscilloscope with 10X probe Isolation Transformer Voltmeter (DC scale) One 500 ohm, 2 Watt or higher, resistor (or two 1K ohm, 1 Watt or higher, resistors connected in parallel) Four 8 ohm, three 6.3 ohm, and one 12 ohm 300 Watt Load Resistors, or resistance and wattage equivalent (See Load Resistor Configuration in Table 1) AC Line Cord One 100 ohm (1 Watt or higher) resistor Note: 100 ohm resistor not needed if MK-10922 Load Clamp Tester is used.
3.0	Visual Inspection:
	Visual inspect case for damage such as cracks, dents, bent edges, or broken connector housings.
4.0	Load Clamp Test:
	4.1 <u>Set Up:</u>
	Put a check in the space provided as each step is completed. Connect a jumper wire between +BYPASS and -BYPASS. Install the 500 ohm 2W resistor across +28VDCOUT and COMMON. Connect the line cord to LINE AC IN and LINE AC RETURN on the FCU (DO NOT plug into wall outlet yet). Plug oscilloscope into isolation transformer and power up. Attach a scope probe to +DCOUT and verify zero volts, referenced to -DCOUT, on the oscilloscope. Set scope time base to about 0.5 s/div. sweep.

Functional Test: 4.2

Enter the CLAMP THRESHOLD RANGE voltage from Table 1 which is correct for 103 - 115 (b) VDC the FCU Model being tested.

Enter the CLAMP WINDOW RANGE voltage from Table 1 which is correct for 95-104 (c) VDC the FCU Model being tested.

Set the voltage of the Load Clamp Tester or DC Power Supply to zero volts before turning on. Turn on the Tester or DC Power Supply and raise the voltage slowly. If the voltage level on the scope does not rise with the voltage input from the Tester or DC Power Supply, turn off voltage, remove top cover, and verify that good contact is being made between boards on the Molex connectors and try again. If the voltage level on the scope does rise, raise the voltage to the range recorded in blank (b). Turn up the voltage about 10 more volts or until you observe the voltage on the scope which rises slowly to a maximum voltage and then falls quickly to a minimum voltage (sawtooth waveform).

	Enter the maximum voltage here Enter the minimum voltage here	(d) VDC
2) 3)	Is voltage (d) within the voltage range of (b)? Is voltage (e) within the voltage range of (c)?	1/

If questions (2) and (3) are both answered YES then check the "PASS" blank provided and proceed to the DCOUT Output Test.

PASS_ Load Clamp Test

If question (2) is answered NO, turn off all power to the FCU and remove the top cover (see MAINTENANCE Section of the FCU User's Manual MN-33) and verify that the two large fuses are in the fuseholders mounted to the side cover. If the fuses are in place, obtain schematic C-98361 and board assembly C-112401 and find the Small Signal circuit board that is above the transformer. Verify that the value of R20 on this board matches the resistor value specified in the Resistor Table of the Small Signal Board Schematic C-98361. If not, replace this resistor with the proper value and repeat Load Clamp Test. If the resistor value is correct, check "FAIL" and terminate the testing on this unit. Tag this unit with a date and a "FAILED LOAD CLAMP THRESHOLD TEST" label.
