**Description**

The HCPL-2231/2 are dual-channel, optically-coupled logic gates. The detectors have totem pole output stages and optical receiver input stages with built-in Schmitt triggers to provide logic compatible waveforms, eliminating the need for additional waveshaping.

A superior internal shield on the HCPL-2231/2 guarantees common mode transient immunity of 5,000 V/μsec at a common mode voltage of 300 volts.

The electrical and switching characteristics of the HCPL-2231/2 are guaranteed from -40°C to +85°C and a V<sub>CC</sub> from 4.5 volts to 20 volts. Low I<sub>F</sub> and wide V<sub>CC</sub> range allow compatibility with TTL, LSTTL, and CMOS logic and result in lower power consumption compared to other high speed couplers. Logic signals are transmitted with a typical propagation delay of 150 nsec.

1. Each channel.
2. Duration of output short circuit time should not exceed 10ms.
3. Device considered a two terminal device: pins 1, 2, 3 and 4 shorted together, and pins 5, 6, 7 and 8 shorted together.
4. The  $t_{PLH}$  propagation delay is measured from the 50% point on the leading edge of the input pulse to the 1.3V point on the leading edge of the output pulse. The  $t_{PHL}$  propagation delay is measured from the 50% point on the trailing edge of the input pulse to the 1.3V point on the trailing edge of the output pulse.

5.  $CM_L$  is the maximum slew rate of the common mode voltage that can be sustained with the output voltage in the logic low state.  $V_O < 0.8V$ .  $CM_H$  is the maximum slew rate of the common mode voltage that can be sustained with the output voltage in the logic high state  $V_O > 2.0V$ .
6. This is a proof test to validate the UL 220 Vac rating. This rating is equally validated by a 2500 Vac 1 sec test.
7. See Option 010 data sheet for more information.
8. Measured between pins 1 and 2, shorted together, and pins 3 and 4, shorted together.
